No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 52,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 11,

Sequence 6, Application US/08911423
Patent No. 6111090
GENERAL INFORMATION:
APPLICANT: Gorman, Daniel M.
APPLICANT: Randall, Troy D.
APPLICANT: Slotnik, Albert
TITLE OF INVENTION: MAMMALIAN CELL SURFACE ANTIGENS; RELATED
TITLE OF INVENTION: REAGENTS
NUMBER OF SEQUENCES: 8
CORRESPONDENCE ADDRESS:
ADDRESSEE: DNAX Research Institute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/911,423 FILING DATE: 14-AUG-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CLASSIFICATION: 536

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

THE ALPHA RALNS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
SIMILARITY: BELONGS TO THE INSULIN RECEPTOR FAMILY OF TYROSINE-PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Biochem. Biophys. Res. Commun. 187:934-939(1992).

-!- FUNCTION: THIS RECEPTOR BINDS INSULIN-LIKE GROWTH FACTOR I (IGF I)
WITH A HIGH AFFINITY AND IGF II WITH A LOWER AFFINITY. IT HAS A
TYROSINE-PROTEIN KINASE ACTIVITY.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE - ADP +
                                                                                                                                                                                                                                                                                                  Eukaryota; Métazoa; Chórdata; Craniata; Vertebrata; Euteleostomi;

"Aberrant differentiation of neuromuscular junctions in mice lacking s-laminin/laminin beta 2.";
Nature 374:258-262(1995).
-I- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ -I- FUNCTION: BINDING TO CELLS VIA A HIGH AFFINITY RECEPTOR, LAMININ OF CELLS INTO TISSUES DURING EMBRYONIC DEVELOPMENT BY INTERACTING WITH OTHER EXTRACELLULAR MATRIX COMPONENTS.
-I- FUNCTION: LAMININ-3 (S-LAMININ) REGULATES THE FORMATION OF MOTOR NERVE TERMINALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBGULIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTING OF THREE DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WHICH ARE BOUND TO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED MOLECULE COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END. THE BETA-2 CHAIN IS A SUBUNIT OF LAMININ-3 (S-LAMININ), LAMININ-4 (S-MEROSIN), AND LAMININ-7 (KS-LAMININ).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEMBRANES (MAJOR COMPONENT).
TISSUE SPECIFICITY: NEUROMUSCULAR SYNAPSE AND KIDNEY GLOMERULUS.
DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT
WITH OTHER LAMIN CHAINS TO FORM A COLLED COLL STRUCTURE.
DOMAIN: DOMAINS VI AND IV ARE GLOBULAR.
SIMILARITY: CONTAINS I LAMININ N-TERMINAL DOMAIN (DOMAIN VI).
SIMILARITY: CONTAINS 12 LAMININ BGF-LIKE DOMAINS.
SIMILARITY: CONTAINS 12 LAMININ DOMAIN IV.

- I- FUNCTION: RECEPPOR FOR TNF-ALPHA. HIGH AFFINITY FOR TNA-ALPHA AND APPROXIMATELY 5-FOLD LOWER AFFINITY FOR TNF-BETA.

- I- PUNCTION: RECEPPOR FOR TNF-BETA.

- I- PTM: PHOSPHORYLATED; MAINLY ON SERINE RESIDUES WITH A VERY LOW LEAVELOW THESEJUES.

- I- PTM: PHOSPHORYLATED; MAINLY ON SERINE RESIDUES WITH A VERY LOW WETH-AYERST). USED TO TREAT MODERATE TO SERVERE RHEUMATOID WYETH-AYERST). USED TO TREAT MODERATE TO SERVERE RHEUMATOID WYETH-AYERST). USED TO TREAT MODERATE TO SERVERE RHEUMATOID PORTION OF THERE CONSIST OF THE EXTRACELLULAR LIGAND-BINDING PORTION OF THERE CONSIST OF THE EXTRACELLULAR LIGAND-BINDING PORTION OF THE TALKED TO AN IMMUGLOBULIN FC CHAIN. IT BINDS TO THE ALCHARA AND BLOCKS ITS INVERACTIONS WITH RECEPPORS.

--- SIMILARITY: CONTRAINS A LA-NGFR/TNER-TYPE CYSTEINE-RICH REGION.

"Characterization of the MRC OX40 antigen of activated CD4 positive T
lymphocytes - a molecule related to nerve growth factor receptor.";
EMBO J. 9:1063-1068(1990).
-!- FUNCTION: RECEPTOR FOR THE OX40L/GP34 CYTOKINE.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: ACTIVATED T-CELLS.
-!- SIMILARITY: CONTAINS A LA-NGFR/TNFR-TYPE CYSTEINE-RICH REGION.
                                                                                                                                                                                                               Gaps
